An AFCI is a product that is designed to detect a wide range of arcing electrical faults to help reduce the electrical system from being an ignition source of a fire.

We explain how an arc fault circuit breaker (AFCI) can prevent home fires as well as the NEC requirements for their use in residential homes.

Electrical safety is no longer optional-it is a requirement in modern residential and commercial construction. With evolving building codes and increasing demand for safer electrical ...

An arc-fault circuit-interrupter, or AFCI breaker, prevents fires by sensing when an electrical arc is about to occur and instantly disconnecting the damaged circuit before the arc builds ...

Since 2002, electrical standards have required a new device called an Arc Fault Circuit Interrupter (or AFCI for short) for bedroom outlets. An "outlet" is any place where electricity is tapped ...

In the United States, arcing faults cause more than 30,000 home fires each year, resulting in hundreds of deaths and injuries and more than \$750 million in property damage. The solution to this problem is ...

AFCIs are devices designed to protect against fires caused by arcing faults in the home electrical wiring. The AFCI circuitry continuously monitors the current and discriminates between normal and ...

AFCI receptacles are designed to recognize an arc fault and quickly trip to stop the flow of electricity to prevent the electrical system from being an ignition source of a fire.

AFCI stands for Arc Fault Circuit Interrupter (aka AFDD = arc-fault detection device). It is a protective device used for protection against fire hazards caused by arc faults.
