Our research addresses the critical intersection of communication and power systems in the era of advanced information technologies. We highlight the ...

We investigate the use of wind turbine-mounted base stations (WTBSs) as a cost-effective solution for regions with high wind energy potential, since it could replace or even outperform current solutions ...

The assessment of suitability of a certain location for the installation of a wind farm requires the consideration of multiple impact issues: visual aspects, environmental effects such as the impact on ...

In this paper we assess the benefits of adopting renewable energy resources to make telecommunications network greener and cost-efficient, ...

This paper addresses the feasibility of using renewable energy sources to power off-grid rural 4G/5G cellular base-stations based on Kuwait's solar irradiance and wind potentials.

One key element of deciding to build a renewable electricity project is identifying a suitable location for the project. Assessing a potential site for a ...

Our study introduces a communications and power coordination planning (CPCP) model that encompasses both distributed energy resources and base stations to improve communication ...

The alternative is a greenfield deployment, where capable radios are mounted on newly built high towers that at least partially replace the legacy deployment, but with a lower site count.
