What factors should you consider when buying solar panels?

If you have plenty of extra space, cost per watt is the most crucial factor when buying solar panels. Solar Cell Efficiency: Amount of usable energy that's converted from the total amount of sunlight. Cost Per Watt: Total cost for every watt of energy a solar panel is capable of producing. Solar panel cost ÷ solar panel wattage rating.

What are bifacial solar panels?

Bifacial solar panels are designed to absorb sunlight from both the front and back surfaces. They can capture reflected light from surfaces like rooftops or the ground, increasing their overall energy production. These panels are more expensive but can generate up to 30% more electricity than traditional monofacial panels in optimal conditions.

Who should install solar panels?

Solar panels should be installed by licensed professionals. Since solar panels are designed for extensive round-the-clock use, their warranties are good for anywhere between three to 25 years, and companies will repair or replace solar panels as needed.

What do you need to know about solar panels?

Solar panels have dozens of specifications. You can compare them on my solar panel comparison table. But as a consumer, I'd argue there are only three you need to know about: Solar panel efficiency measures the percentage of sunlight energy hitting a panel's surface that is converted into electrical energy. The higher, the better.
