What is a GIS based PV generation potential assessment system?

A GIS and MCDM based PV generation potential assessment system is proposed. Theoretical power generation and land suitability is assessed. Spatial characteristics of PV power generation potential is analyzed. Clear spatial dislocations between PV power generation potential and population distribution and electricity demand.

Are solar panels the cheapest form of power generation?

Solar panels can be produced in such quantity and at such low cost that it is now the cheapest form of power generation. They could solve not just renewable energy's greatest shortcomings, but those of power generation globally, fundamentally transforming how we produce, store and consume power.

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.

How efficient is a solar PV system?

Experimental PV cells and PV cells for niche markets, such as space satellites, have achieved nearly 50% efficiency. When the sun is shining, PV systems can generate electricity to directly power devices such as water pumps or supply electric power grids.

Based on the determination of photovoltaic model system, four typical geographical locations are selected and PV system is applied to the simulation study.
