Can large-scale battery energy storage systems participate in system frequency regulation?

In the end, a control framework for large-scale battery energy storage systems jointly with thermal power units to participate in system frequency regulation is constructed, and the proposed frequency regulation strategy is studied and analyzed in the EPRI-36 node model.

Do energy storage systems participate in frequency regulation?

Current research on energy storage control strategies primarily focuses on whether energy storage systems participate in frequency regulation independently or in coordination with wind farms and photovoltaic power plants .

Why do we need to control the frequency of the power grid?

With the development of new power systems, a large number of new energy sources are connected to the power grid, which will bring great difficulties to the peak shaving of the power grid. Therefore, in this context, it is necessary to control and regulate the frequency of the power grid.

Can large-scale energy storage battery respond to the frequency change?

Aiming at the problems of low climbing rate and slow frequency response of thermal power units, this paper proposes a method and idea of using large-scale energy storage battery to respond to the frequency change of grid system and constructs a control strategy and scheme for energy storage to coordinate thermal power frequency regulation.

In summary, this integrated strategy presents a robust solution for modern power systems adapting to increasing renewable energy utilization.
