How do modular data centers work?

Modular data centers adopt a top wiring system and the indoor cabling rack is mounted on top of the modular racks. High and low voltage power are separated. The power distribution cabinets provide the power supply for network cabinets. The battery pack can be installed in the battery room.

What is an independent cooling system in a modular data center?

An independent cooling system is used in the modular data center to meet the cooling requirements in all areas. Modular data centers deploy hot and cold aisles and use in-row cooling units.

Can a battery pack be installed in a modular data center?

The battery pack can be installed in the battery room. Modular data centers are supervised with or without a color touch panel assigned to each module. Upload of information is executed via a touch panel in the former case, or DAM in the latter case. Modular data centers are equipped with Class B and C lightning protection systems.

What features are included in a modular data center?

Modular data centers are equipped with Class B and C lightning protection systems. The touch panel (optional) shows information about the PDC, precision cooling, power distribution cabinets, the environment in the racks, water leakage, temperature, humidity, smoke detection, door status, and more.
