What is a solar panel?

A Solar panels (also known as &quot; PV panels&quot;) is a device that converts light from the sun,which is composed of particles of energy called &quot;photons&quot;,into electricity that can be used to power electrical loads.

What are the components of a solar panel?

The main component of a solar panel is a solar cell,which converts the Sun 's energy to usable electrical energy. The most common form of solar panels involve crystalline silicon -type solar cells. These solar cells are formed using layers of elemental silicon and elements such as phosphorus and boron.

How do solar panels work?

The flow of electricity results from the characteristics of the semiconductors and is powered entirely by light striking the cell. The main component of a solar panel is a solar cell,which converts the Sun 's energy to usable electrical energy. The most common form of solar panels involve crystalline silicon -type solar cells.

What are the different types of solar panels?

The most common form of solar panels involve crystalline silicon -type solar cells. These solar cells are formed using layers of elemental silicon and elements such as phosphorus and boron. The elements added to the silicon layers form an n -type layer, which has an excess of electrons, and a p -type layer, which has a deficit of electrons.
